

Honey testing available

American foulbrood kills honey bee brood (larvae and pupae) and can easily spread across your hives if not detected early. To reduce the incidence of American foulbrood disease and the loss of colonies and hives, you can still get your honey tested at Gribbles Veterinary Pathology.

- We will provide you with a kit - this will be tailored to your needs (the number of apiaries).
- We will discuss your requirements and ensure you understand the testing process.
- We will provide you with written instructions on how to collect your honey samples

American Foulbrood culture cost: \$34.85 (ex GST) per single sample. This cost reduces depending on the number of samples to be tested.

Honey sample and yard (apiary) identification

For beekeepers with one yard (apiary) of hives

If your hives are located at one yard (apiary) and you are submitting one sample only, write here the words "YARD ONE" on the honey sample and on this sheet here:

For beekeepers with more than one yard (apiary) of hives

Choose a different number for each yard (apiary) so you will be able to identify the yard when you receive the test results. Write the same number on the honey sample and on this sheet here:

Samples submitted: Each sample to have 125mL of clean honey.

Date Sample(s) Collected:

PAYMENT DETAILS - please note: payment must be made prior to testing
